

Monthly Report — April 2026

Project: Multi Brand Prompt Generator

Period: 2026-04-02 → 2026-04-28

Activity: ~520 commits, 211 files changed, +12,704 / -975 lines

1. Email HTML Conversion (major new feature)

A full email-template generation pipeline was added so brand campaigns can be exported as ready-to-send HTML.

- New modal: [EmailHtmlConversionModal.tsx](#) (826 lines, new)
- New builder: [build-email-html.ts](#) (717 lines, new)
- Per-brand email header art generated for all 9 brands ([public/brand-references/](#)) — [email-header.png](#), [email-header-bg.png](#), plus Gemini/OpenAI source variants
- Supabase tables added via migrations: [001_brand_email_config.sql](#), [002_brand_email_header.sql](#), [003_apply_brand_headers.sql](#)
- Header assets uploaded to Supabase storage via [upload-brand-headers.mjs](#)
- Final design locked in commit [77880cc](#) — *"Remove atlanta-newsletter variant, finalize email header design"*

2. Sports Banner Wizard

New flow for generating sports campaign banners.

- [SportsBannerWizard.tsx](#) + [useSportsBannerWizard.ts](#) (refined this month)
- New builder: [build-banner-html.ts](#) (248 lines, new)
- Prompt intelligence layer: [prompt-intelligence.ts](#)
- Specs documented: [SPORTS-BANNER-GUIDELINES.md](#), [SPORTS-BANNER-PROPOSAL.md](#)

3. Image Library — major rebuild

The image library moved from a tiny localStorage list to a synced, paginated, modal-driven gallery.

- [ImageLibrary.tsx](#) — +486/-... significant rewrite
- New persistent store: [imageStore.ts](#) (126 lines, new)

- New API routes:
- [list-drive-images.ts](#) — server-side Drive listing
- [migrate-images.ts](#) — migration helper
- [image-proxy.ts](#) — CORS/proxy wrapper for Drive URLs
- Modal upgrades: [ImageModal.tsx](#), [LikedImageViewModal.tsx](#), [LikedImagesPanel.tsx](#)

4. Image Generation Pipeline

- [generate-variations.ts](#) — switched to **OpenAI gpt-image-1 edit API** directly (no GCP) per project rule
- [generate-variations-imagen.ts](#) — separate Imagen path expanded
- [generate-image.ts](#) — major expansion (+422 lines)
- [edit-image.ts](#) — GCP Cloud Run path hardened
- **Critical fix** ([ef43a94](#), 2026-04-17): *"inline Drive auth in each API route — Vercel requires self-contained functions"* — unblocked production deploys

5. Brand Asset Tooling

A scraping + compositing pipeline so we can pull source brand artwork on demand.

- [scrape-brand-assets.mjs](#), [scrape-brand-assets-pw.mjs](#) (Playwright variant)
- [generate-brand-headers.mjs](#), [composite-brand-headers.mjs](#)
- [upload-brand-assets.mjs](#)
- New brand-standards module: [brand-standards.ts](#), color extraction helper [extractColors.ts](#)
- Commit [a954718](#) — *"Add brand-asset scrapers + gitignore scraped outputs"*

6. Documentation & Tooling

- [CLAUDE.md](#) rewritten to reflect the post-n8n / post-Airtable Supabase + Drive stack
- New mirrors: [AGENTS.md](#)
- [.env.example](#) added (99 lines) — first proper env template
- [BRD-FEEDBACK.md](#) captured stakeholder feedback
- GitNexus code-intelligence skill files added under [.claude/skills/gitnexus/](#)

7. Test & Verification Scripts

~25 Playwright/Python capture scripts added to [scripts/](#) — image-library timing, variations panel, skeleton loading, email-header previews, etc. Used to drive screenshot-based UI verification.

Headline Outcomes

1. **Email HTML export shipped end-to-end** — modal, builder, per-brand headers, Supabase config tables.
2. **Sports Banner Wizard introduced** as a parallel generation flow.
3. **Image Library rebuilt** with server-side Drive listing, proxy, and migration path — no longer purely localStorage.
4. **Variations API moved to direct OpenAI** (gpt-image-1), bypassing GCP for that route.
5. **Vercel deploy unblocked** by inlining Drive auth into each function.
6. **Brand asset pipeline** stood up so artwork no longer has to be hand-collected.

Known Carry-overs

- Image Library file IDs still cached in browser localStorage — Supabase persistence path is built ([migrate-images](#), [imageStore](#)) but not yet the default. Switching domains can still wipe the gallery until that's flipped on.
